

Security for the Atomized Network

Netography Fusion®

Cloud-Native Network Defense Platform for All Your Cloud and Network Traffic

“

In the end, we achieved complete visibility and better security detections across all of our environments - including on-premises and multi-cloud, Netography Fusion ingests and enriches flow data at massive scale without hardware, complicated network taps in chokepoints, or costly deep packet inspection and decryption.

Shannon Ryan, Senior Director,
Core Security Services and
Architecture, FICO

Netography Fusion® accelerates your response to anomalies and threats across your hybrid, multi-cloud, and on-prem networks from a single console. Your security, network, and cloud operations teams will become more effective with the 100% cloud platform that delivers unmatched visibility without deploying sensors, agents, or taps:

- **Close Your Control Gaps:** Gain comprehensive multi-cloud and on-prem control without deploying sensors, agents or taps
- **Validate Your Governance:** Ensure compliance with Zero Trust, TikTok, and other policies in real-time
- **Accelerate Your Threat Actor Detection:** Respond in real-time before threat actors disrupt operations
- **Reduce Your DDoS Damage:** Validate the performance of your DDoS mitigation technologies to minimize the cost and impact of a DDoS attack

Unify Your Network Visibility

Netography Fusion shows you what your devices, users, applications, and data are doing and what's happening to them in real time, from a single console. You gain unmatched awareness from aggregated, normalized, and enriched metadata collected from your multi-cloud and on-prem network, including all five major cloud providers and the physical and virtual devices you have already deployed.

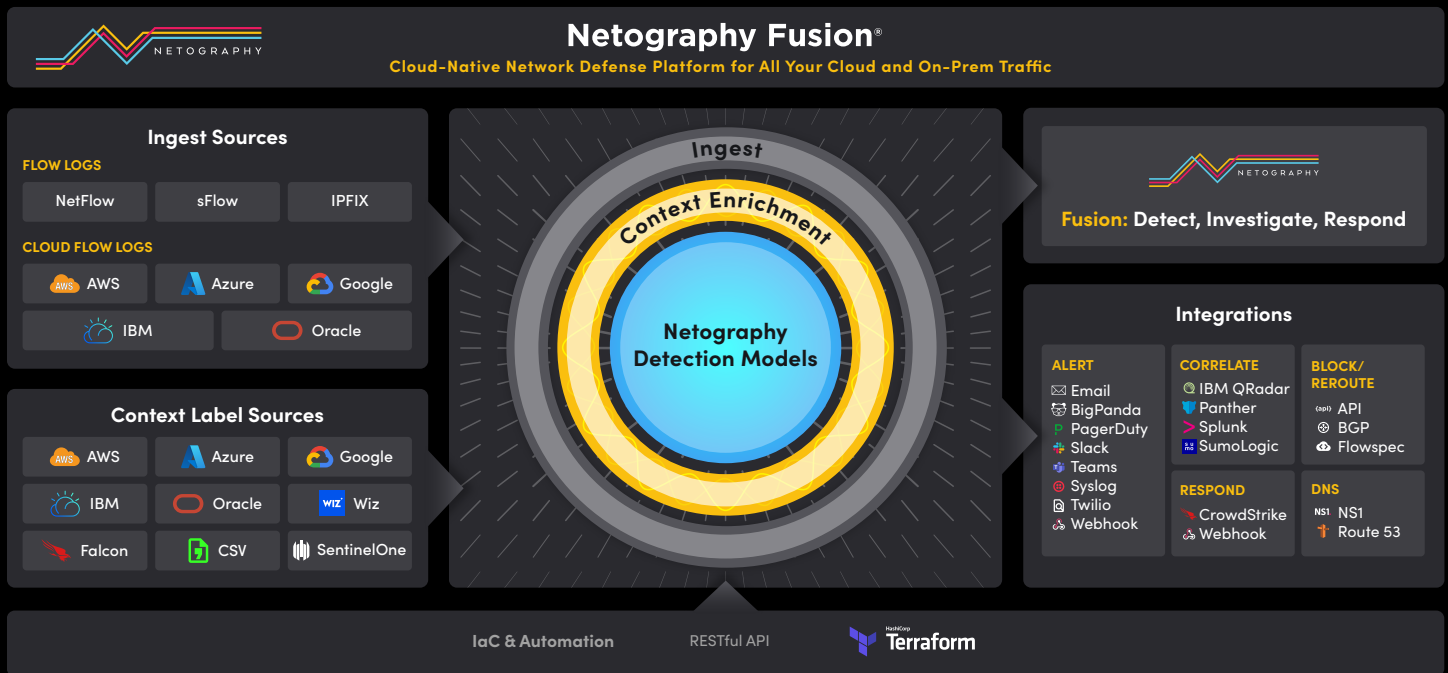

Real-time detection of anomalous and malicious activity enables you to respond faster and reduce the risk of operational disruption.

Detect Anomalies and Compromises Faster

Netography Fusion delivers high-fidelity alerts that identify anomalous or malicious network activity in real-time across your Atomized Network. These context-rich alerts enable you to reduce the dwell time of any threat actor and respond to malicious activity that has evaded your other detection technologies before damage can occur.

Understand Critical Context

You can tag applications, assets, users, locations, environments, or business units with critical context labels from your CMDB, asset management, Active Directory and EDR systems. You can then use these labels to create custom dashboards and searches and automate response workflows.

Netography Fusion delivers unmatched visibility of network activity and context across data, applications, devices, and users.

Integration Across Your Technology Stacks

The Netography Fusion platform integrates with your technology stack to make your people, products, and processes more effective. It integrates with leading vendors and offers a real-time RESTful API for technologies not in our partner ecosystem. Our integrations accelerate detection and investigation and automate response to anomalies and threats.
